1 S4 Extracellular (Potential).
55 77 Signal-anchor for type III membrane
                                                                                                                                                           O9Y275:TNFSF13B; NDExp=1; IntAct=EB1-519945, EB1-519169; SUBCELLULAR LOCATION: Type III membrane protein. Plasma membrane and perinuclear Golgi-like structures.
TISSUE SPECIFICITY: Expressed in mature B-cells, but not in T-
               family member TALL-1.",

Proc. Natl. Acad. Sci. U.S.A. 97:9156-9161(2000).

-!- FUNCTION: Receptor for TNFSF13B/BLPS/BAFF and TNFSF13/APRIL.

Promotes B-cell survival and plays a role in the regulation of humoral immunity. Activates NF-kappa-B and JNK.

-!- SUBUNIT: Associates with TRAF1, TRAF2, TRAF3, TRAF5 and TRAF6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Breakpoint for translocation to form IL2/TNFRSF17 oncogene.

                                                                                                                                                                                                                                                                          Isoid=088472-2; Sequence=VSP_006507;
-1-TISSUS SPECIFICITY: Detected in spleen, thymus
heart, and at lower levels in kidney and lung.
-1- SIMILARITY: Contains 1 TNPR-Cys repeat.
                                                                                                                                                                        Event=Alternative splicing; Named isoforms=2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1 CSQNEYFDSLLHACIPCOLRCSSNTPPLTCORYC 34

Intestine, adrenals and lung but not in the brain.

Intestine, adrenals and lung but not in the brain.

Isold=00459-2; SanGE: Weakly expressed throughout the embryo, except in the developing nervous system, the ribs and the liver, but markedly up-regulated at discrete sites during development. At ES-5, intense expression observed in differenciated decidua. At ES-5, intense expression in extraembryonic endoderm, amnion and nascent mesoderm. At ES-5, abundant expression in AER (thickened decidua. At ES-5, abundant expression in AER (thickened ectodermal cells of limb buds). At ES-5, expression in the limbs is confined to the condensing mesenchym surrounding the cartilage. At this stage, strong expression also detected in vertebral and facial cartilage primordia and in the muscle of the intestinal villi. Isoform A is most abundant at all stages but significant levels of isoform B occur at ES-2.

Isoldorm B occur at ES-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This Swiss-Prot entry is copyright. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.

TOPO DOM 1 166 Signal-anchor for type III membrane

TRANSMEM 166 186 Signal-anchor for type III membrane
IsoId=014836-2; Sequence=VSP_013798;
-!- TISSUE SPECIFICITY: Highly expressed in spleen, thymus, small intestine and peripheral blood leukcoytes. Expressed in resting B-cells and activated T-cells, but not in resting T-cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FPQGLWTGVAMRSCPEEQYWDPLLGTCMSCKTICNHQSQRT

                                                                                                                                                                                                                                                                                                                                                             SUBUNIT: Probably forms covalent oligomers.
SUBCELLULAR LOCATION: Type I membrane protein, exclusively on the apical region of the sperm head.
TISSUE SPECIFICITY: In testis, primarily in haploid spermatids.
DOMAIN: The MAM domains probably mediates sperm adhesion to the cona pellucida.
DOMAIN: During sperm migration through the reproductive tracts, the mucin-like domain might inhibit inappropriate trapping of spermatozoa or promoting adhesion to the oviductal isthmus.
DOMAIN: The VWFD domain 2 may mediate covalent oligomerization (By
